

— MICROSOFT BUILD 2026 · JUNE 2-3 · SAN FRANCISCO

GitHub & Copilot at Build 2026

The headlines for developers: agentic workflows move front and center, a new Copilot desktop app, and a shift toward Microsoft-first coding models.

Focus: GitHub · GitHub Copilot · Developer tooling

— WHAT WAS ANNOUNCED

Four things that matter for developers

Technical preview

GitHub Copilot App

An agent-native desktop control center to launch, manage, and monitor multiple AI agents working in parallel — debugging, backlog items, and PR review.

Workflow shift

Agentic development

From "AI writes code" to "AI participates in the whole delivery workflow" — auditable agents tied into Actions, review, and deployment controls.

New models

MAI-Code-1

A Microsoft AI model tuned for GitHub/VS Code coding tasks — faster and lower cost — alongside reasoning model MAI-Thinking-1.

Roadmap

Project Polaris

Microsoft's own coding model, reported to begin replacing GPT-4 in GitHub Copilot — a move toward Microsoft-first developer models.

— THE GITHUB COPILOT APP

A control center for agentic development

- › **Run agents in parallel** across isolated worktrees — debugging, backlog work, and PR review at the same time.
- › **Unified "My Work" view** to track active agent sessions, issues, pull requests, and background automations.
- › **Canvas** — a shared surface for human and agent collaboration.
- › **Inspectable sandboxes** for parallel execution, plus expanded code review with custom agent skills.
- › **Copilot SDK** for building your own automations.
- › **Availability:** preview for Copilot Pro, Pro+, Business & Enterprise — on Windows, Mac & Linux.

— WHY IT MATTERS

From assistant to teammate

- › The theme is **agentic DevOps**: multiple AI agents participating across the engineering lifecycle, not just autocomplete.
- › Everything stays **auditable and governed** — agents plug into existing review, Actions, and deployment controls.
- › Microsoft is leaning into **its own models** (MAI-Code-1, Project Polaris) for coding workloads.
- › Tooling polish too: **Copilot CLI** voice mode & tabbed navigation; richer context via **Microsoft IQ**.

Note on sourcing: Build 2026 wrapped on June 3, 2026. The most firmly confirmed GitHub item is the Copilot desktop app. Details like Project Polaris timing and individual model names come largely from press/recap coverage and may still be refined in official posts.
